Data Analyst – Beginner Level

Project Title: Superstore Sales Analysis and Dashboard
Tools Used: Google Sheets, Formulas, Pivot Tables, and Charts
Dataset Source: Sample Superstore Dataset – Kaggle

1. Introduction

As part of the ShadowFox Virtual Internship, I completed a beginner-level data analytics project using the Sample Superstore dataset. The objective was to analyse business sales data, identify performance trends, and present meaningful insights through visualizations and a dashboard.

2. Objectives

- Understand and organize a business dataset.
- Calculate key performance indicators (KPIs).
- Analyse sales and profit across product categories and regions.
- Identify monthly sales trends and communicate findings using a dashboard.

3. Dataset and Methodology

The Sample Superstore dataset contains business information related to orders, customers, product categories, sales, profits, quantities, regions, and order dates.

I used Google Sheets to organize the raw data, prepare the analysis sheets, perform calculations, and create pivot tables. Charts were developed to summarize the findings and present the results in an understandable format.

4. Key Performance Indicators

The following KPIs were calculated for the dataset:

- **Total Sales:** $2,297,200.86
- **Total Profit:** $286,397.02
- **Total Orders:** 5,009
- **Total Quantity Sold:** 37,873
- **Average Order Value:** $458.61

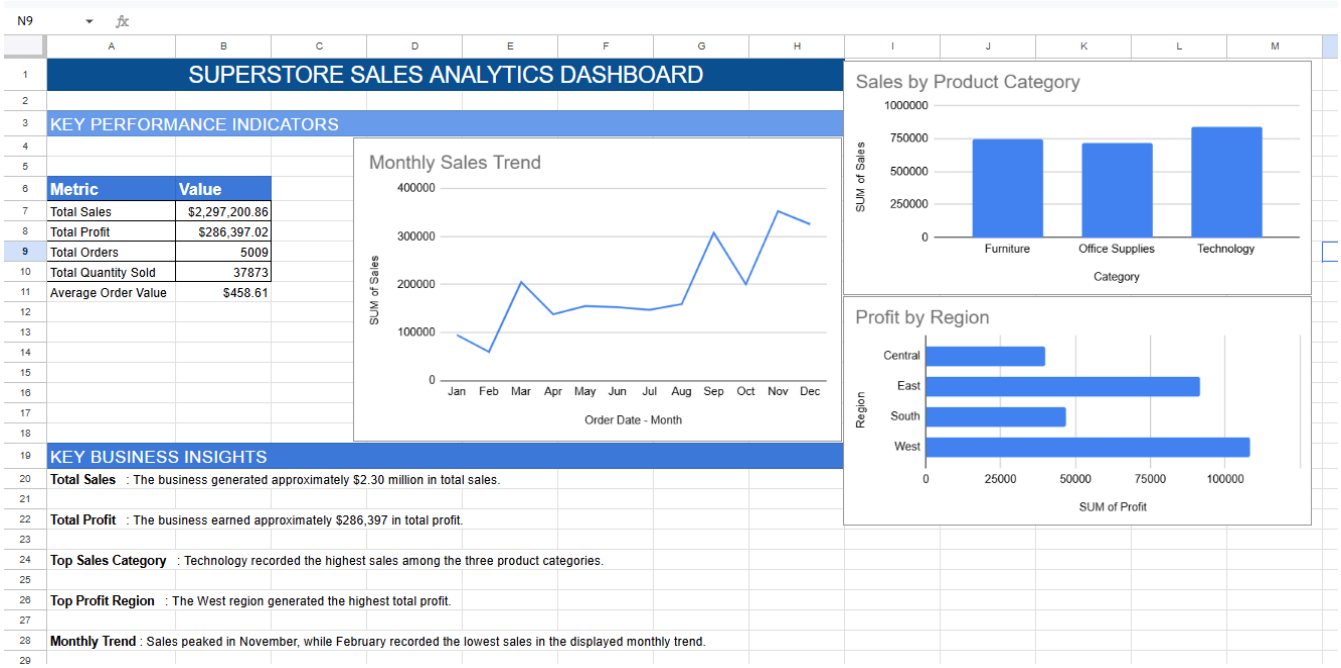

5. Dashboard and Key Findings

The final dashboard combines KPI summaries with charts for sales by product category, monthly sales trends, and profit by region.

The analysis indicated that:

- Technology recorded the highest sales among the three product categories.
- November recorded the highest monthly sales, while February recorded the lowest.
- The West region generated the highest profit among the regions analysed.

These findings help illustrate differences in product performance, seasonal sales patterns, and regional profitability.

6. Conclusion

This project provided practical experience in spreadsheet-based data analysis, KPI calculation, pivot tables, data visualization, and dashboard creation. It helped me understand how raw business data can be transformed into meaningful insights that support business decisions.

Through this internship project, I strengthened my analytical thinking and developed a foundation for further learning in data analytics.
